The Critical Section Problem

State Diagrams

Proving Correctness

## The Critical Section Problem

- N processes execute (infinite) instruction sequences concurrently
- Each process is divided into two sub-sequences:  
*critical* section and *non-critical* section
- Correctness properties:
  - **Mutual exclusion:** Instructions from critical sections of two or more processes must never be interleaved
  - **No deadlock:** If *some* processes are trying to enter their critical sections, then *one* of them must eventually succeed
  - **No starvation:** If *any* process tries to enter its critical section, then it must eventually succeed

## The Critical Section Problem

- Further assumptions:
  - Synchronization mechanism consisting of pre-protocol and post-protocol before and after each critical section
  - Protocols use variables not accessed by critical or non-critical section
  - Processes may delay infinitely in non-critical sections
  - Processes do not delay infinitely in critical sections
- Further requirement: efficiency
  - Pre- and post-protocols require as little time and memory as possible, particularly in the case of no contention

## Atomic Load and Store

- Assumption 1: every individual base memory cell (word) load and store access is *atomic*
- Assumption 2: there is *no* atomic combined load-store access

`G : Natural := 0; -- assumed to be mapped on a 1-word cell in memory`

```
task body P1 is
begin
  G := 1;
  G := G + G;
end P1;
```

```
task body P2 is
begin
  G := 2;
  G := G + G;
end P2;
```

```
task body P3 is
begin
  G := 3;
  G := G + G;
end P3;
```

What will be the value of `G` after it is initialized, and at program exit?

## First Attempt

```
type Task-Token is range 1 .. 2;
```

```
Turn: Task-Token := 1;
```

```
task body P is
```

```
begin
```

```
  loop
```

```
p1    -- non-critical section P
```

```
p2    loop exit when Turn = 1; end loop;
```

```
p3    -- critical section P
```

```
p4    Turn := 2;
```

```
  end loop;
```

```
end P;
```

```
task body Q is
```

```
begin
```

```
  loop
```

```
q1    -- non-critical section Q
```

```
q2    loop exit when Turn = 2; end loop;
```

```
q3    -- critical section Q
```

```
q4    Turn := 1;
```

```
  end loop;
```

```
end Q;
```

- Mutual exclusion? Deadlock? Starvation?

## Proving Correctness: State Diagrams

- Markov Property: no history

*p5*    *a* := *a* + 1;

Assignment Project Exam Help

Value of *a* at p6 only depends on value at p5

<https://powcoder.com>

- Program state is tuple of program counters and variable values

e.g. (p2, q3, 1)

Add WeChat powcoder

- process p is at statement p2
- process q is at statement q3
- Turn = 1
- State diagram: states (tuples), transitions, starting state

## State Diagrams

```
type Task_Token is range 1 .. 2;
```

```
Turn: Task_Token := 1;
```

```
task body P is
```

```
begin
```

```
loop
```

```
p1    -- non-critical section P
```

```
p2    loop exit when Turn = 1; end loop;
```

```
p3    -- critical section P
```

```
p4    Turn := 2;
```

```
end loop;
```

```
end P;
```

```
task body Q is
```

```
begin
```

```
loop
```

```
q1    -- non-critical section Q
```

```
q2    loop exit when Turn = 2; end loop;
```

```
q3    -- critical section Q
```

```
q4    Turn := 1;
```

```
end loop;
```

```
end Q;
```

## Proof: Mutual Exclusion

- Too many states!  
4 states \*  
4 states \*  
2 values of turn  
= 32  
(only 16 reachable)
- Mutual exclusion:  
 $\square \neg (p3 \wedge q3)$

M. Ben-Ari, 2006

## Collapsing States

```
type Task-Token is range 1 .. 2;
```

```
Turn: Task-Token := 1;
```

```
task body P is
```

```
begin
```

```
loop
```

```
p1    -- await Turn = 1;
```

```
p2    Turn := 2; -- critical
```

```
end loop;
```

```
end P;
```

```
task body Q is
```

```
begin
```

```
loop
```

```
q1    -- await Turn = 2;
```

```
q2    Turn := 1; -- critical
```

```
end loop;
```

```
end Q;
```

## Proof: No Deadlock

If some processes are trying to enter their critical section then one must eventually succeed

$$(p1 \wedge q1) \rightarrow \Diamond(p2 \vee q2)$$

M. Ben-Ari, 2006

## (Non-Abbreviated) First Attempt

```
type Task-Token is range 1 .. 2;
```

```
Turn: Task-Token := 1;
```

```
task body P is
```

```
begin
```

```
  loop
```

```
p1    -- non-critical section P
```

```
p2    loop exit when Turn = 1; end loop;
```

```
p3    -- critical section P
```

```
p4    Turn := 2;
```

```
  end loop;
```

```
end P;
```

```
task body Q is
```

```
begin
```

```
  loop
```

```
q1    -- non-critical section Q
```

```
q2    loop exit when Turn = 2; end loop;
```

```
q3    -- critical section Q
```

```
q4    Turn := 1;
```

```
  end loop;
```

```
end Q;
```

- Mutual exclusion? Deadlock? Starvation?

## Proof: No Starvation

If *any* process tries to enter its critical section, then it must eventually succeed

$p2 \rightarrow \Diamond p3$   
 $q2 \rightarrow \Diamond q3$

M. Ben-Ari, 2006
